

solving problems with computers

digitalisierung und programmierung · input, session 2

agenda

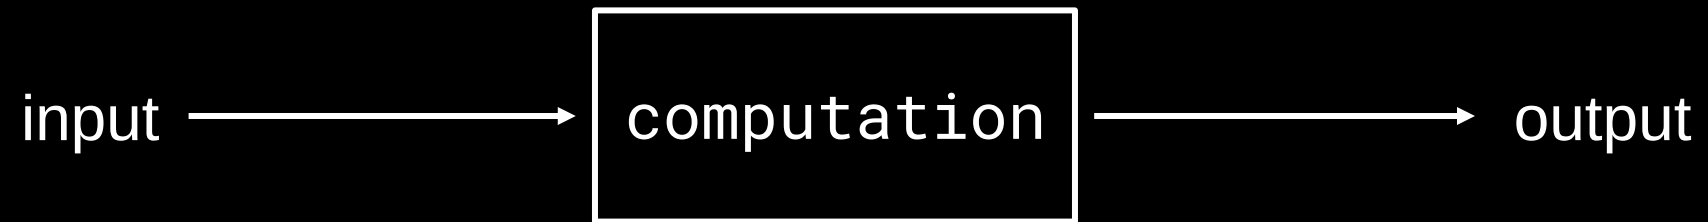

- 1 every piece becomes a box
- 2 the boxes of this project
- 3 the two questions behind it

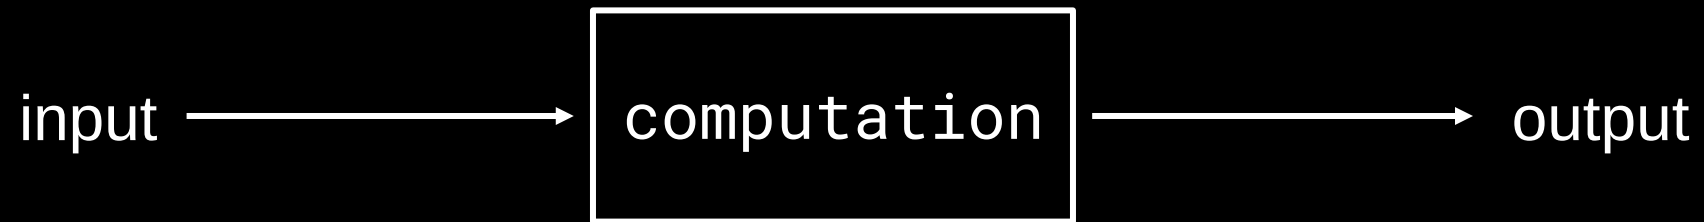

every piece becomes a box

what happens
in between?

the boxes of this project

your sender is a box

your receiver is a box

your receiver is a box

```
r = 203  
g = 41  
b = 57  
c = 310
```

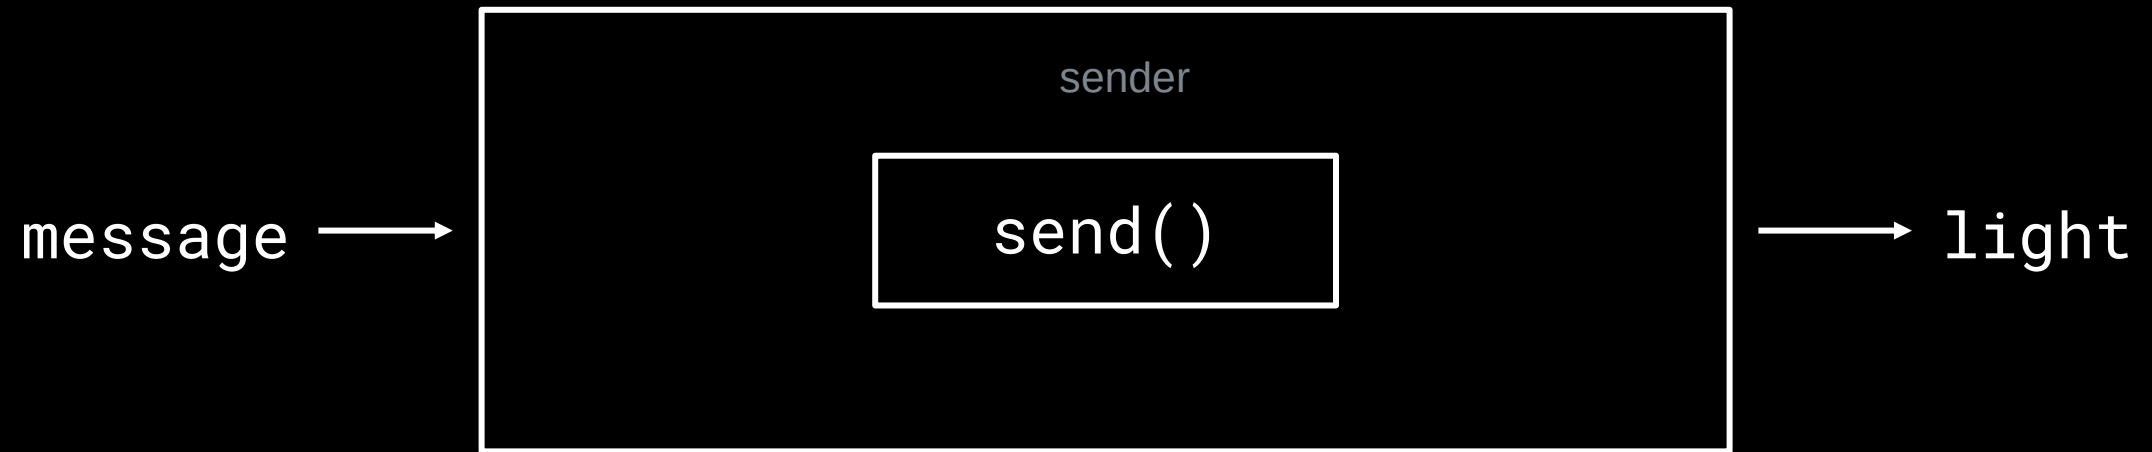

the sensor does not see "red". it sees four numbers.

boxes plug together

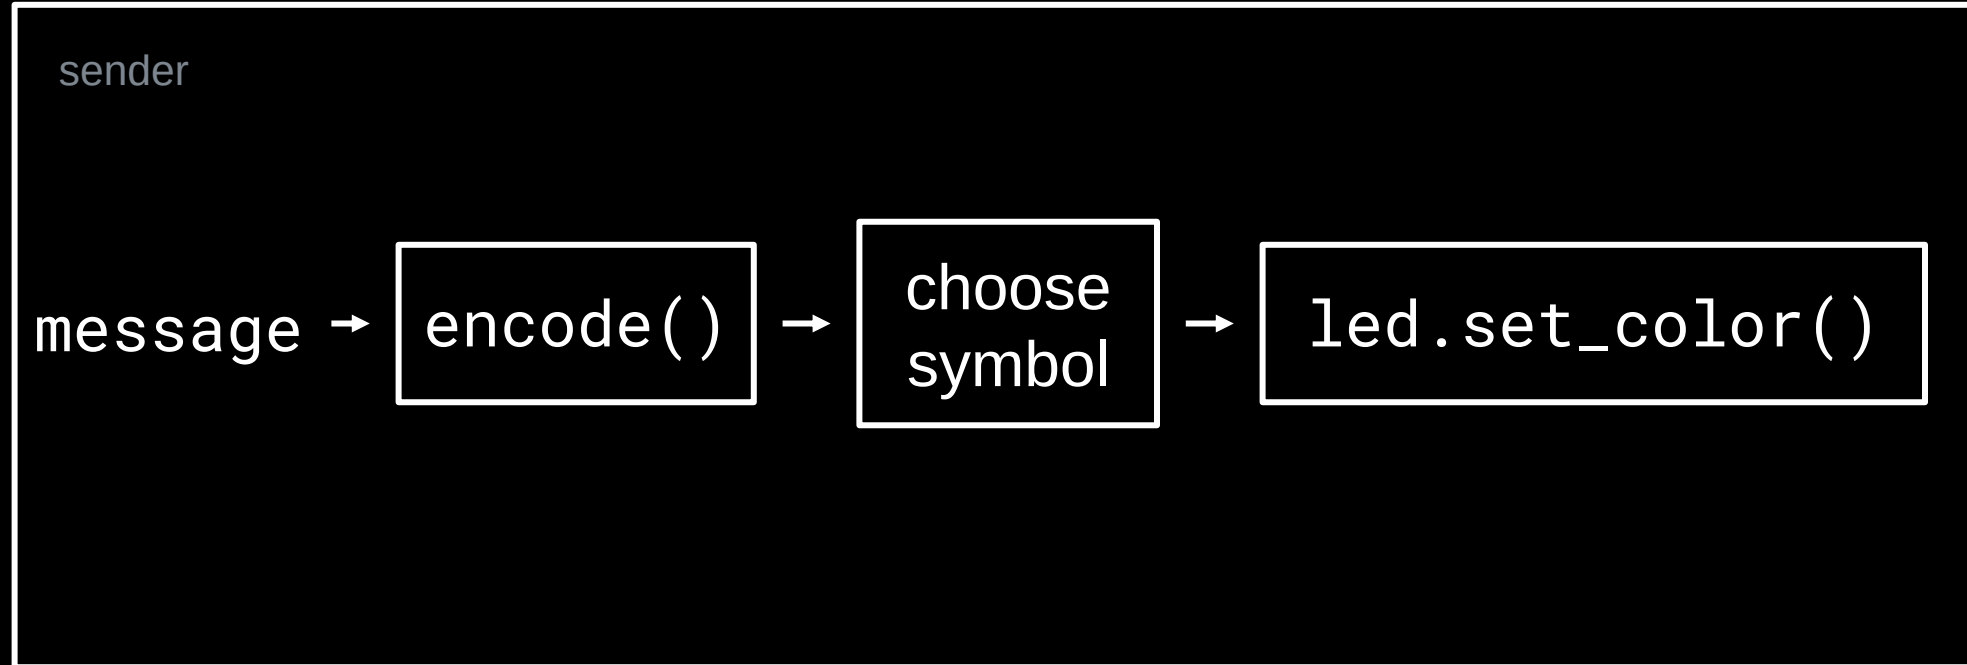

boxes can contain boxes

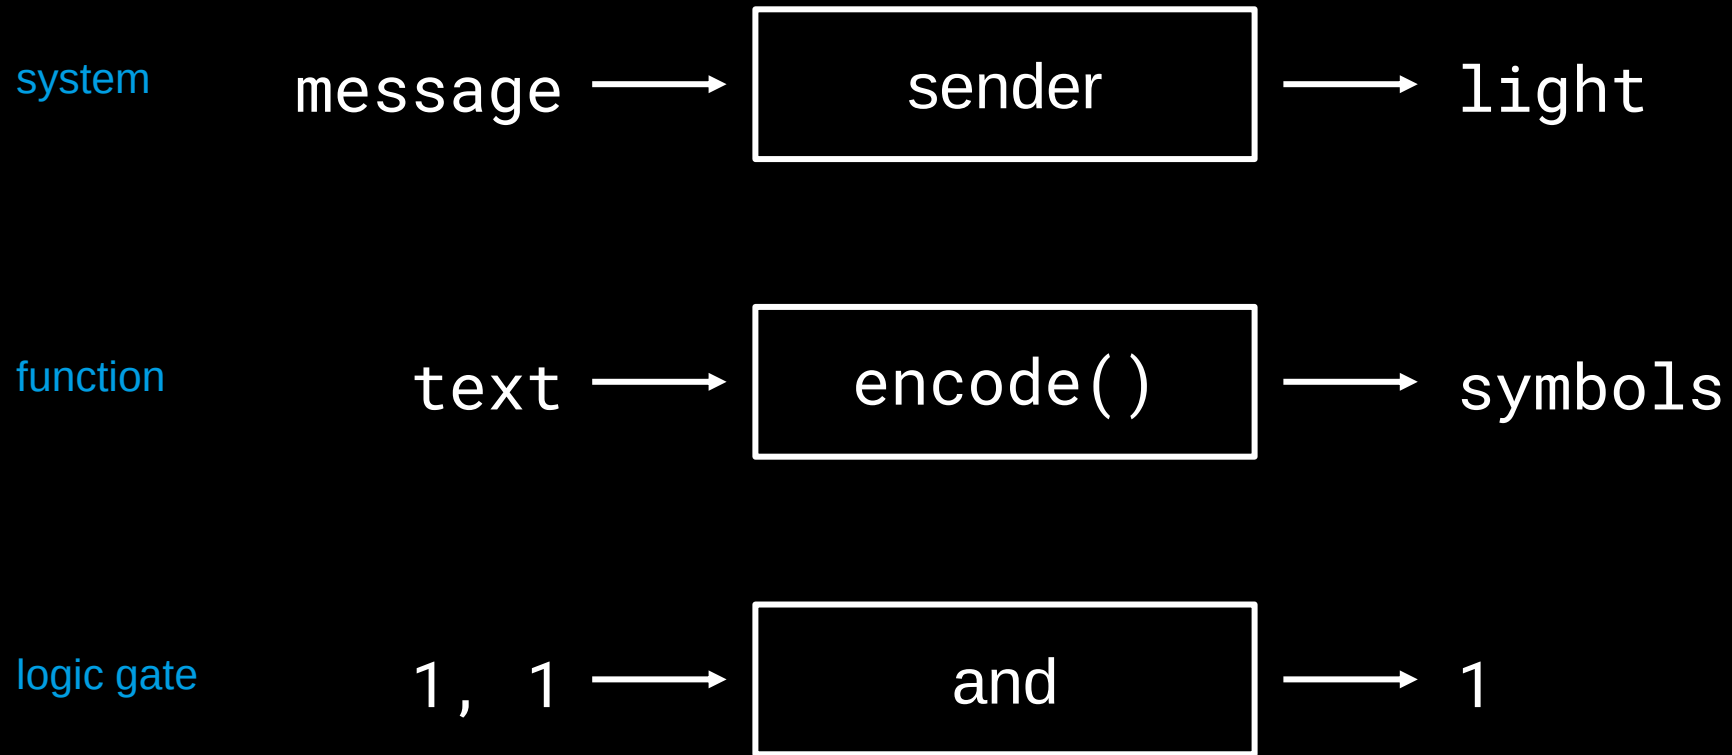

from outside, the whole sender is one box.

open the box

the processing of one box becomes a chain of smaller boxes.

the same model works at every level

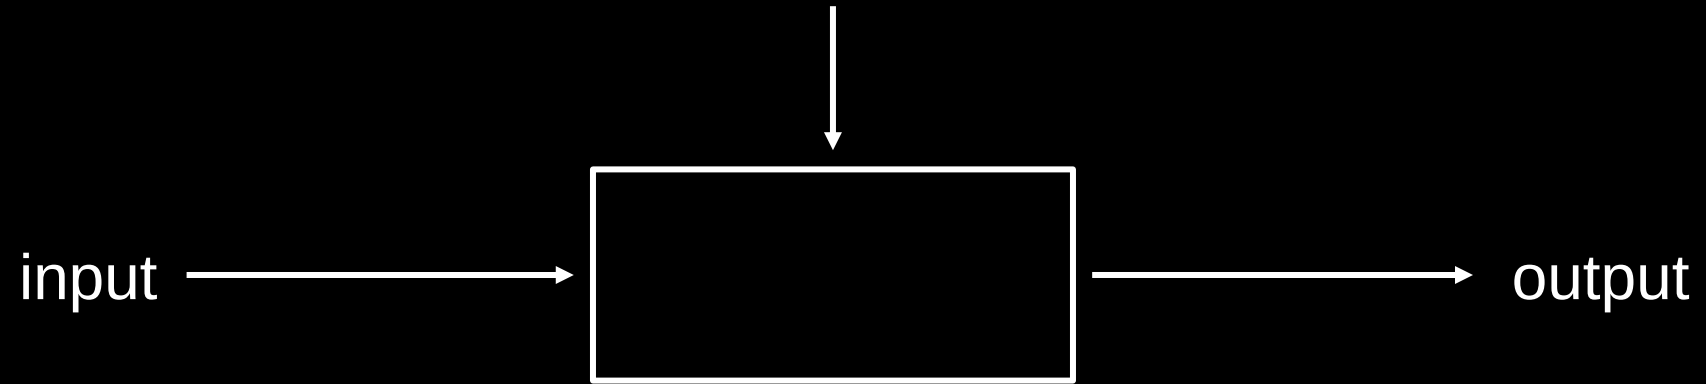

in a row: data flow

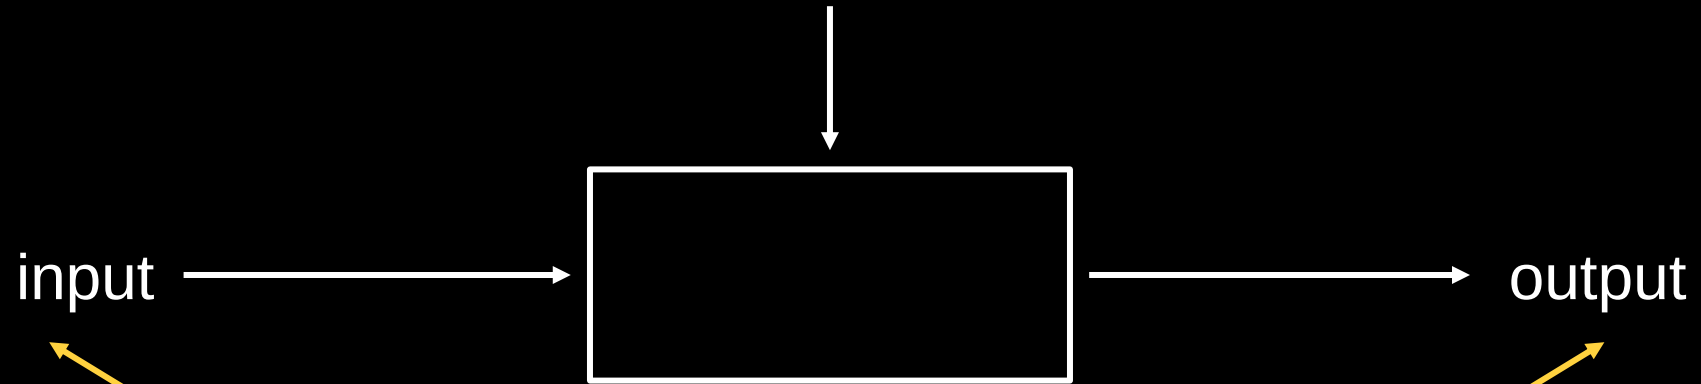

inside each other: decomposition

the two questions behind it

how does the box do its work?

how does the box do its work?

how do we write things down
so a machine can work with them?

where the two questions take us

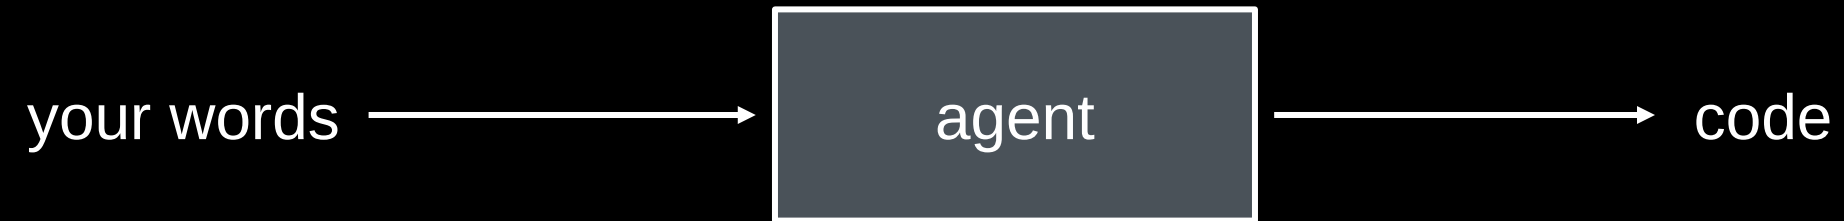

the box: today

what is a program?

input and output: the coming weeks

what the sensor measures
symbols and information
code systems

the agent is a box too

the box is not yours. the test is.

a program is what happens
inside the box.
